

Contribution Journal

Ranveer Chand

During the L02 assignment my contribution was downloading the L02 Lab and uploading it into Google Colab. Next, working through all the cells like importing python libraries and working with the Iris dataset. After the lab was completed, I created a reflection on the lab about what I learned in a word document. Then I downloaded both the lab and reflection in pdf format and because of the fault of our group and the instructions, our submissions were incorrectly submitted. So, I had to email the professor and thankfully he opened the submissions again for us to properly submit. Finally, I communicated with our group through GroupMe so they can send me their files, and I can properly submit it alongside the Contribution Journal I created.

John Nasir

My contribution to L02 activities was in Google Colab. I imported and worked with Python libraries such as Pandas, NumPy, Matplotlib, and Scikit-learn, and explored the Iris dataset, And did basic statistical analysis. I also completed the dataset observations and reflection sections, saying my findings about the different iris species and explaining how the lab improved my understanding of machine learning tools and workflows.

My contribution to the L02 assignment involved completing the lab activities in Google Colab. I downloaded and uploaded the lab file, then worked through each section by importing and using Python libraries such as Pandas, NumPy, Matplotlib, and Scikit-learn. During the lab, I explored the Iris dataset and examined the characteristics of the different iris species. I also completed the observations and reflection portions of the assignment, where I summarized my findings and what I learned. After finishing the lab and reflection, I sent the lab files over to Ranveer who is submitting all the documents for the group.

Working with this lab taught me that tools like Pandas and NumPy are incredibly powerful because they let you manipulate and analyze entire tables of data instantly without writing slow, manual loops. I also learned that making graphs with Matplotlib isn't just a final step for a presentation, but a vital diagnostic tool that helps you visually spot hidden patterns. It showed me how abstract statistical numbers directly translate into real world, physical characteristics.
