Reflective Journal

This was my first time working with NumPy, pandas, matplotlib, and sklearn. Going in I didn't know anything because I'm still taking Python 1 alongside this class, so I wasn't sure I'd be able to keep up with the code. It was rough at first, but I used Gemini to explain the parts I didn't understand, and it wasn't as complicated as I expected.

Pandas was the most immediately useful thing. Having the data in a DataFrame made it much easier to read than looking at raw output. Same with the visualizations instead of trying to make sense of rows of numbers, I can just look at the plot and see the dataset easier. The scatter plot showed me that setosa was completely separate from the other two species, which I probably wouldn't have noticed if I was just reading the data.

GitHub feels straightforward to me now. Before it was just extra steps but now, I understand that it saves snapshots of your work makes it very useful for anyone in any field that involves working with multiple files and helps avoid losing your work.

One question I still have is whether computer vision identifies iris species by color from a photo? Every feature in this dataset was manually measured. CV would let a model pull that information from an image instead, which I don't really want to deal with right now because I'm taking computer vision as well and it is a lot more coding and very complicated.
