

Contribution Journal

Ranveer Chand

For this lab, I started by downloading the notebook and uploading it to Google Colab, then sharing it with all group members so everyone had access. We decided I would handle all the code portions first, then we'd go over the results together and each group member would take one of the knowledge check questions to answer. Once everyone had their parts done, I put together two Word documents, one for the group reflection journal and one for the contribution journal. Then I compiled everyone's work into each document. After that, I downloaded all the files in the required formats, made sure everything was named correctly, and created a new folder in our GitHub repository to upload everything for submission.

For this lab, I completed Question 3, and I worked together with my classmates to discuss the steps, compare outputs, and make sure our approaches were consistent with the lab instructions. We collaborated on understanding the imputation strategies and encoding decisions, but each of us completed our own required sections individually. My contribution focused on finishing Question 3 and helping the group interpret the results correctly.

In this lab, we monitored the model to make sure the model processed the data correctly, we also made sure that the algorithm correctly analyzed and processed the data, and discussed amongst ourselves our individual thought process, approach, and opinion on the data collection. Once we visualized the data, and the data was visualized in a way in which we thought was up to our satisfaction, we came up with ideas and approaches we may want to implement for the project, so we can try to be effective as possible.

From the knowledge check, I took the 2nd question for the group contribution. One-Hot Encoding is like building a bridge between human life and computer code. By turning words into columns of 1s and 0s, we aren't just doing math, we are just literally translating our world into a simple binary language that a calculator can finally understand.
